No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 33

Computer search generated synthetic peptides - are inhibitors of HIV transmission.

Example; Fig 1; 182pp; English

This peptide is isolated from HIV-1 isolate RF, and is a homologue of the peptide DP-178. DP-178 corresponds to amino acids 638 to 673 of the HIV-1 isolate LAI transmembrane protein gp41. It forms a putative alpha helix at the C-terminal end of the gp41 ectodomain, and complexes with DP-107 (corresponds to amino acids 558-595) which contains a leucine zipper motif. The peptides complex via non-covalent protein-protein interactions, and possess anti-viral activity. The peptide inhibits transmission to uninfected cells, and can also be used as type and/or subtype specific diagnostic tools. (Updated on 25-MAR-2003 to correct PN

AAW17012-W17016 are DP-178 homologues that are useful in the treatment of HIV infection. DP-178 is a peptide corresponding to residues 638-673 of HIV type 1 glycoprotein 41 (gp41) transmembrane protein. DP-178 and its derivatives/homologues are used in combination with a therapeutic agent, e.g a reverse transcriptase, viral protease, cytokine, glycosylation or viral mRNA processing inhibitor or a nucleoside inhibitor. The peptides work by inhibiting viral replication or inhibiting transmission. They may also be used in vaccines for protecting against HIV infection. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Compans. contg. DP-178 or DP-107 in combination with other therapeutic agent - useful for treatment of HIV infection, esp. by inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Long lasting fusion peptide inhibitor; viral infection; antiviral; antifusogenic; mobile blood component; measles virus; MeV; SIV; sinian immunodeficiency virus; human parainfluenza virus; HPVV; human respiratory syncytial virus; human immunodeficiency virus; HIV.
                                                                                                                                                                                                          HIV; SIV: human; simian immunodeficiency virus; glycoprotein 41;
transmembrane; antiviral; DP-178; DP-107; vaccine; inhibition;
replication; transmission.
                                                                                                                                                                    DP-178-like peptide useful for treatment of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              HIV antiviral activity exhibiting peptide SEQ ID NO:4.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequences given in AAR98398-408 represent peptides which exhibit antifusogenic activity, antiviral capability and/or the ability to modulate intracellular processes involving coiled-coil peptide structures. These peptides are recognised by the ALMOTIS, 107x178x4 and PLZIP search motifs. These peptides may be used to inhibit the transmission of a virus, pref. HIV, influenza virus, or heparitis B virus, to a cell. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Inhibiting viral transmission, e.g. HIV or RSV, to a cell - using an isolated peptide recognised by an ALLMOTIS, 107x178x4 or PLZIP sequence search motif.
                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention describes a modified therapeutic peptide (1) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide componed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Core polypeptide; enhancer; antiviral; anti-HIV; virucide; hepatotropic; antiinflammatory; hybrid polypeptide; colled-coil peptide interaction; fusion-related disorder; bacterial infection; viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                    Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         intracellular uptake and interference with physiological processom AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a modified anti-viral peptide (I)

comprising a peptide that exhibits anti-viral activity and a reactive
group which is reactive with amino groups, hydroxyl groups, or thiol
groups on blood components to form stable covalent bonds. (I) has anti-
cviral and anti-fusogenic activities. (I) inhibits viral infection of
cells by inhibiting cell-cell fusion or free virus infection or to reduce
the level of membrane fusion events between two or more entities, e.g.,
virus-cell or cell-cell, relative to the level of membrane fusion that
cocurs in the absence of the peptide. (I) is useful in the treatment of
patients who are suffering from viral infection, e.g. HIV, RSV, HBIV,
MeV, and SIV. (I) may be administered prophylactically to previously
uninfected individuals. This is useful in cases where an individual has
components of the blood, such as immunoglobin, serum albumin, red
lived components of the activity is extended for days to weeks.
This is due to improved stability in vivo and a reduced ausceptibility to
peptidase or protease degradation. This minimises the need for more
frequent, or even continual, administration of the peptides. AAB54784

The present sequence is a core polypeptide which may be linked to an anovel hybrid polypeptide. The hybrid polypeptide exhibited to form a novel hybrid polypeptide. The hybrid polypeptide exhibited by the core polypeptide when introduced into a living system. It is used to increase the in vitro or ex vivo half-life of the core polypeptide when introduced into a living system. It is used to increase the in vitro or ex vivo half-life of the core polypeptide. The hybrid and core polypeptides can be used for modulating tusgenic events and intracellular processes involving coiled coil peptide interactions. Other uses include preventing, treating and/or alagnosing disporders involving fusion events (e.g. modulation of neurotransmitter exchange and sperm-egg fusion), intracellular processes involving coiled-coil peptides (e.g. bacterial infections) and viral infections that involve cell-cell and/or virus, respiratory syncytial virus, Epstein Barr virus, hepatilis B virus, Mason-Pfizer virus and reduces the clearance rate of therapeutic peptides, which increases their effects. In addition, this increases the sensitivity of the diagnostic
                                                                                                                                                                                             New hybrid polypeptide, useful for preventing, treating and diagnosing e.g. viral infections, comprises an enhancer peptide linked to a core

The present sequence is a core polypeptide which may be linked to an enhancer peptide to form a novel hybrid polypeptide. The hybrid confered sexibites enhanced pharmacokinetic properties relative to those exhibited by the core polypeptide when introduced into a living system It is used to increase the in vitro or ex vivo half-life of the core polypeptide. The hybrid and core polypeptides can be used for modulating fusogenic events and intracellular processes involving coiledcoil peptide interactions. Other uses include preventing, treating and/or diagnosing disorders involving fusion events (e.g. modulation of neurotransmitter exchange and sperm-egg (usion), intracellular processes involving coiled-coil peptides (e.g. bacterial infections) and viral infections caused by human immunodeficiency virus, respiratory syncytial virus, Epstein-Barr virus, hepatide sequence increases the half-life and reduces the clearance rate of therapeutic peptides, which increases their efficacy and minimises the incidence and severity of adverse side efficacy and minimises the incidence and severity of adverse side efficacy and minimises the incidence and severity of adverse side efficacy and minimises the incidence and severity of the diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, HIV-1, human immunodeficiency virus, gp41, glycoprotein 41, gp120,
anti-HIV; stabilising peptide; viral envelope protein; glycoprotein 120,
alpha-helical region; ectodomain.

The invention relates to isolated analogues of the heptad repeat region peptides DP178 and DP107. DP178 and DP107 correspond to amino acids 638-633 (heptad repeat region HR2) and 558-595 (heptad repeat region HR1) respectively, of HIV-ILAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV specification. The present sequence is a peptide provided in the specification. (Updated on 06-bUG-2003 to correct OS field.) (Updated on 11-SEP-2003 to standardise OS field)
respectively, of HIV-ILAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠે
                                                                        The Infortion Feature of Mich Larget regions of viral envelope proteins auch as the gp120/gp41 (glycoprotein 120/glycoprotein 41) complex of HIV-1 (human immundeficiency virus 1). Sequences ANUTO19-ANUTO198 and AAU70677-AAU70743 represent stabilising peptides modelling the alphablical regions of the ectodomain of the HIV-1 transmembrane protein to stabilise fusion-active intermediate structures, which can be used as vaccine immunogens. Immunogenic compositions comprise a viral envelope protein or its fragment exterior to the viral membrane, a stabilising peptide to disrupt formation of structural intermediates necessary for viral fusion and entry, and optionally, a viral cell surface receptor or its fragment. The stabilising peptide is capable of associating with the structure. Antibody binding assays are used to determine the ability of immunogen vaccines to generate an immune response to various forms of envelope. Viran neutralisation assays can be used to characterise the antibody response raised against HIV-1 gp41 domains. The sequences and methods are useful for inhibiting antibodies

The invention relates to isolated analogues of the heptad repeat region peptides DP178 and DP107 correspond to amino acids 638-673 (heptad repeat region HR2) and S58-585 (heptad repeat region HR1) respectively, of HIV-ILAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV intection. The present sequence is a peptide provided in the specification. (Updated on 06-40G-2003 to correct OS field.) (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                      Human immunodeficiency virus, HIV, respiratory syncytial virus, RSV, virucide, heptad repeat region, transmembrane protein, gp41, HR1, HR2,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Heptad repeat region peptide analogs useful for inhibiting virus/cells fusion, useful for treating HIV and Respiratory Syncytial Virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 36; DB 4; Length 36

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to isolated analogues of the heptad repeat region peptides DP178 and DP107. DP178 and DP107 correspond to amino acids 638-633 (heptad repeat region HR1) and 558-555 (heptad repeat region HR1) respectively, of HIV-ILAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalantly with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV infection. The present sequence is a peptide provided in the specification. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                              Human immunodeficiency virus; HIV; respiratory syncytial virus; RSV;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated analogues of the heptad repeat region peptides DP178 and DP107. DP178 and DP107 correspond to amino acids 638-673 (heptad repeat region HR2) and 558-555 (heptad repeat region HR1) respectively, of HIV-LIM1 transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV specification. (Updated on 06-MUG-2003 to correct OS field.) (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                        Heptad repeat region peptide analogs useful for inhibiting virus/cells fusion, useful for treating HIV and Respiratory Syncytial Virus infection.

activity. The peptides of the invention (AAU12559-AAU14009) comprise DP178-like and DP107-like peptides. The DP178 peptide corresponds to amino acids 619-673 of the transmembrane protein gp41 from human immunodeficiancy virus I (HIV-1) solate LAI. The DP107 peptide corresponds to amino acids 558-595 of gp41 from HIV-ILAI. The invention also relates to a method of identifying compounds that inhibit the formation of or disrupts a DP107/DP178 complex. The method comprises detecting the formation of a DP107/DP178 complex, both in the presence of a test compound, in a reaction mixture containing DP107 and DP178 peptides. The method is useful for identifying compounds, including small molecule compounds, which may themselves exhibit antifusogenic, antiviral or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, pequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              particularly HIV, transmission to uninfected cells. The present sequence represents one of the DP178-like/DP107-like peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DP107/DP178 complex, especially compounds with antifusogenic, antiviral or intracellular modulatory activity, by detecting the formation of a DP107/DP178 complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     present invention relates to peptides which exhibit anti-retroviral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention relates to peptides which exhibit anti-retroviral activity. The peptides of the invention (AAU12559-AAU14009) comprise activity. The peptides of the invention (AAU12559-AAU14009) comprise to bpine DB108 peptide corresponds to amino acids 639-673 of the transmembrane protein gp41 from human immunodeficiency virus 1 (HIV-1) isolate LAT. The DP107 peptide corresponds to amino acids 558-595 of gp41 from HIV-LLAI. The invention also relates to a method of identifying compounds that inhibit the corresponds to a method of identifying compounds that inhibit the corresponds to a peptiden also performance of a test compound, in a reaction mixture containing DP107 and DP178 peptides. The method is useful for identifying compounds, including small molecule compounds, which may themselves exhibit antifusogenic, committing a intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to uninfected cells. The present sequence corresponds to particularly HIV, transmission to uninfected cells. The present sequence
                                                                                                                                                                                                                               Identifying a compound that inhibits the formation of or disrupts a DP107/DP178 complex, especially compounds with antifusogenic, antiviral or intracellular modulatory activity, by detecting the formation of a DP107/DP178 complex.
                                                                                                                                          Lawless MK, Merutka G;

                                                                                                                                                                                                                                                                                                                                                                                          env polyprotein P - human immunodeficiency virus type 1 (fragment)
N;Alternate names: coat polyprotein
N;Contains: amino end of coat protein gp41; carboxyl end of coat protein gp120
C;Species: human immunodeficiency virus type 1, HIV-1
A;Note: host Homo sapiens (man)
C;Date: 11.Feb-1993 #sequence_revision 31-Dec-1993 #text_change 09-Jul-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  envelope glycoprotein - human immunodeficiency virus type 1 (strain JRFL)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 4, Sequence 4, Sequence 4,
